## Notes on the Data

### DATA COLLECTION AND RESULTS

This report includes data for 109 foundations. The majority of participants are private foundations, 94 of which are classified as non-operating foundations and four as operating foundations. Of the remaining participants, ten are community foundations and one is a public charity. All participants provided investment pool data as of December 31, 2018. The notation of  $n$  denotes the number of institutions included in each analysis.

In Figure 10, bonds include US bonds, global ex US bonds, and high-yield bonds; hedge funds include long/short hedge funds and absolute return hedge funds (ex distressed securities); private equity and venture capital includes non-venture private equity, venture capital, and other private investments; and real assets and inflation-linked bonds include public and private real estate, commodities, inflation-linked bonds, private oil & gas/natural resources, timber, and public energy/natural resources.

### CALCULATION OF THE REAL RATE OF RETURN

The real, or inflation-adjusted, rate of return for a given investment is calculated by dividing the nominal total return by the appropriate deflator for the same time period. Throughout the report, the deflation measure used for this purpose is the Consumer Price Index. Note that simply subtracting the deflator from the nominal total return does not result in an accurate computation of real total return. The formula is:

$$\frac{1 + \text{Nominal Total Return}}{1 + \text{Deflator}} - 1 = \text{Real Total Return}$$

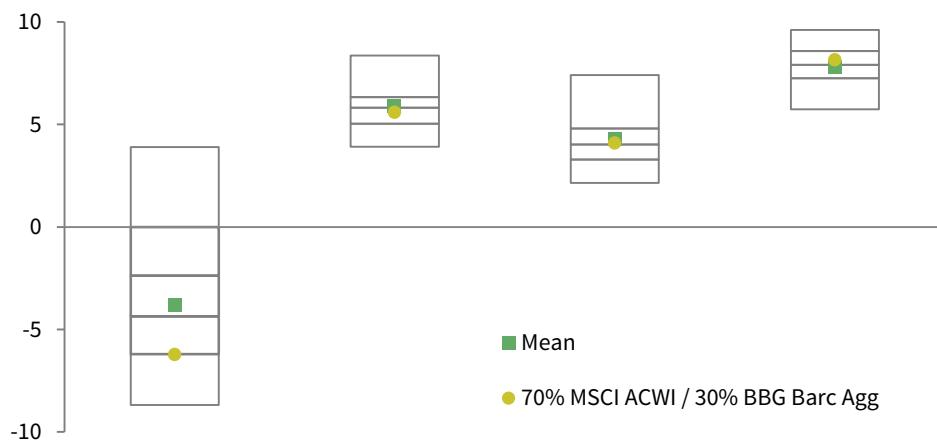

### CALCULATION OF THE RETURN AFTER SPENDING

The rate of return after spending for a given investment is calculated by dividing the total return by the effective spending rate for the time period. The effective spending rate is the dollar amount of spending (endowment spending policy distribution and other annual appropriations) for a fiscal year as a percentage of the beginning market value of assets. The effective spending rate does not include investment management fees that are netted out of returns. Note that simply subtracting the effective spending rate from the total return does not result in an accurate computation of total return after spending. The formula is:

$$\frac{1 + \text{Nominal Total Return}}{1 + \text{Spending Rate}} - 1 = \text{Total Return After Spending}$$

Notes: Please see Figure 7, Performance Reporting Methodologies, for more information on these reporting methodologies. Private investment allocation includes total allocation to non-venture private equity, venture capital, distressed securities (private equity structure), private oil & gas/natural resources, timber, private real estate, and other private investments. Real returns are adjusted for inflation as measured by the Consumer Price Index. After spending returns use the effective spending rates in the calculation. Effective spending rates are fiscal year 2018 spending as a percentage of the January 1, 2018, market value.

## FIGURE 7 PERFORMANCE REPORTING METHODOLOGIES

Illustrations of Methods Commonly Used to Account for Performance of Private Investments

### Performance Reporting Methodology

#### Current Basis

Total investment pool return for 2018 includes marketable asset and private investment performance for January 1, 2018, to December 31, 2018.

#### Lagged Basis

Total investment pool return for 2018 includes marketable asset performance for January 1, 2018, to December 31, 2018, and private investment performance for October 1, 2017, to September 30, 2018.

Source: Foundation data as reported to Cambridge Associates LLC.

Notes: Private investments include total allocation to non-venture private equity, venture capital, distressed securities (private equity structure), private oil & gas/natural resources, timber, private real estate, and other private investments. No PI represents institutions that have no significant private investment allocations (<1% of their total investment portfolios).
