

# THE RISE IN INFLATION

A LOOK AT THE DYNAMICS AT PLAY

## Key points

- Inflation rates have spiked in many countries due in part to the strong economic recovery from 2020's virus-linked downturn, the ongoing disruption in global supply chains, and the recent spike in energy prices.
- Goods prices have been particularly impacted. In the US, goods prices tended to fall in the years leading up to the pandemic, but record levels of government support and reduced demand for services both contributed to higher goods orders.
- That demand led to a surge in Asian exports. Many developed countries reported record levels of new orders, even as prior orders were backlogged. At the same time, inventory levels were low in many countries, which added to price pressures.
- The strong economic recovery has boosted wages in some countries. In the US, the labor market is exceptionally tight, with more job openings than people that are unemployed. So far, wage pressures have been most evident among lower paid and younger workers.
- Home prices in the euro area, Japan, the UK, and the US have also all spiked in the last year, outstripping income growth in those countries. Alongside home prices, energy prices have also soared, as investment and oil & gas rig counts remain at low levels.
- The expectation of higher rates, reduced government support, and a rebalancing of goods/services demand, along with a belief that the functioning of global supply chains will improve, is likely behind the market's belief that inflation will moderate.

## Inflation has spiked in many countries, becoming the dominant market narrative

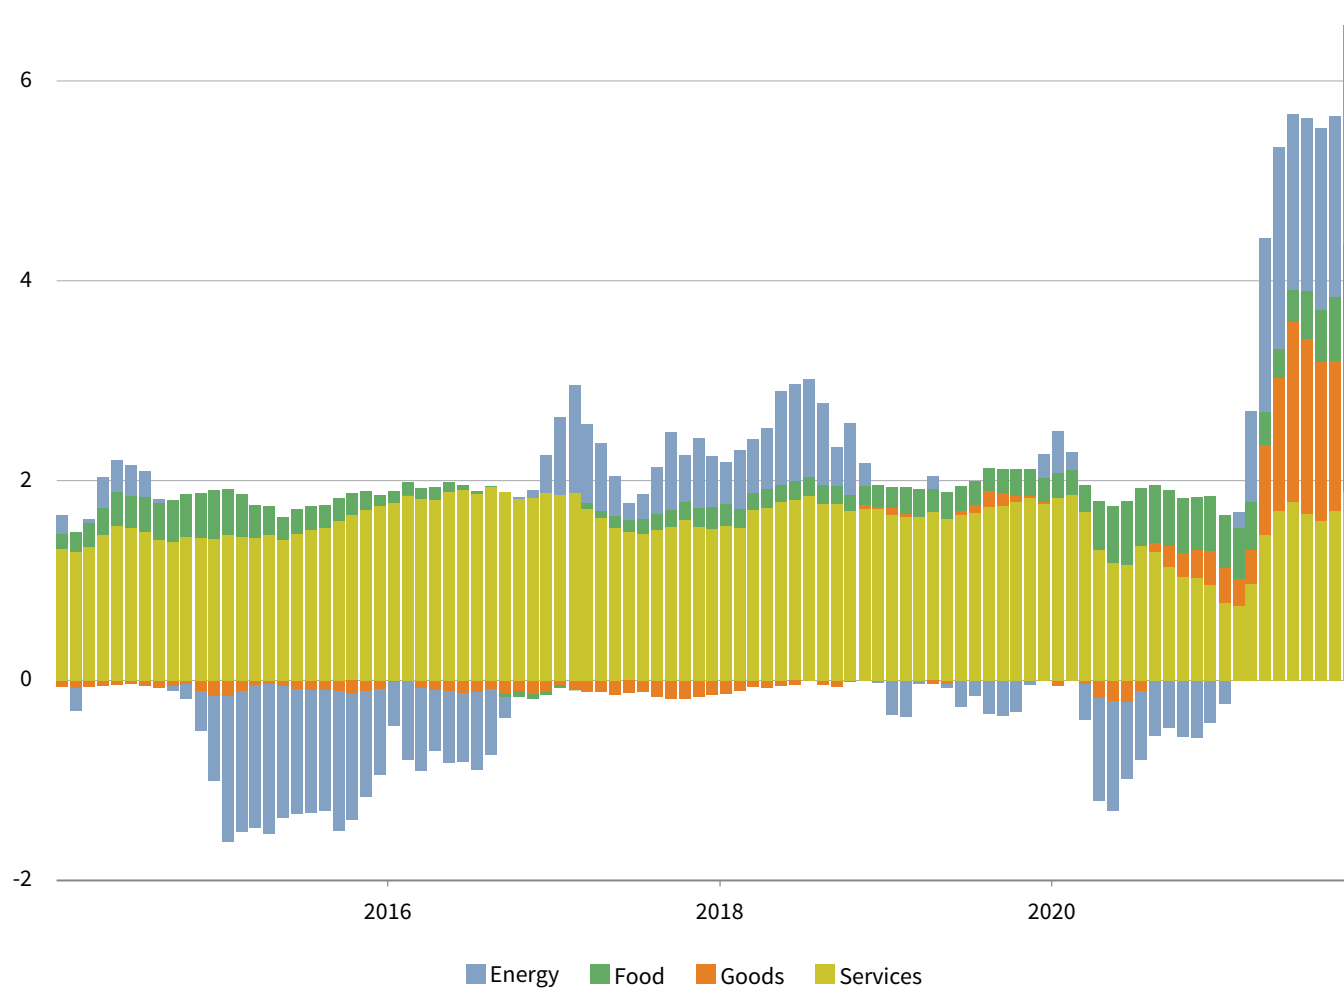

**ANNUAL INFLATION RATES**  
January 2016 – October 2021 • Percent (%)

The jump in many countries' inflation rates are linked to the strong economic recovery from 2020's virus-linked downturn, the recent spike in energy prices, and the ongoing disruption in global supply chains. So far, price pressures have been most acute in the US, where the headline inflation rate hit 6.2% in October. Even after stripping out volatile food and energy items, US core inflation still rose 4.6% in its last reading and is at its highest level since 1991. But Europe eased lockdown measures later than the US, and the Bank of England recently warned inflation could hit 5% early next year, as the accumulated pent-up demand filters through the economy. In the euro area, energy has so far played a prominent role, contributing 2.2 percentage points (ppts) to the October 4.1% headline inflation rate.

## Changes in goods prices has been a large driver of the recent surge in US inflation

**COMPOSITION OF US HEADLINE INFLATION**  
January 2014 – October 2021 • Percent (%)

The pandemic's impact on consumer behavior led to dramatic shifts in underlying price dynamics. At its highest level, it can be seen in US goods inflation, which contributed over 1.5 pts to both core and headline inflation rates in recent months. That level is materially higher than levels in the last business cycle, when advancements in technology and automation from companies like Amazon resulted in goods deflation. Unlike goods, recent services inflation prints were much more consistent with those observed pre-pandemic, which is due in part to smaller changes in medical care services offsetting faster rises in home rental prices. While energy has been a large contributor to US headline inflation in recent months, its highly variable nature is a key reason why energy is often excluded when making inflation forecasts.

## Government support aided the economic recovery and supported inflation

### G4 MONEY SUPPLY

December 1995 – June 2021 • Percent (%) of GDP

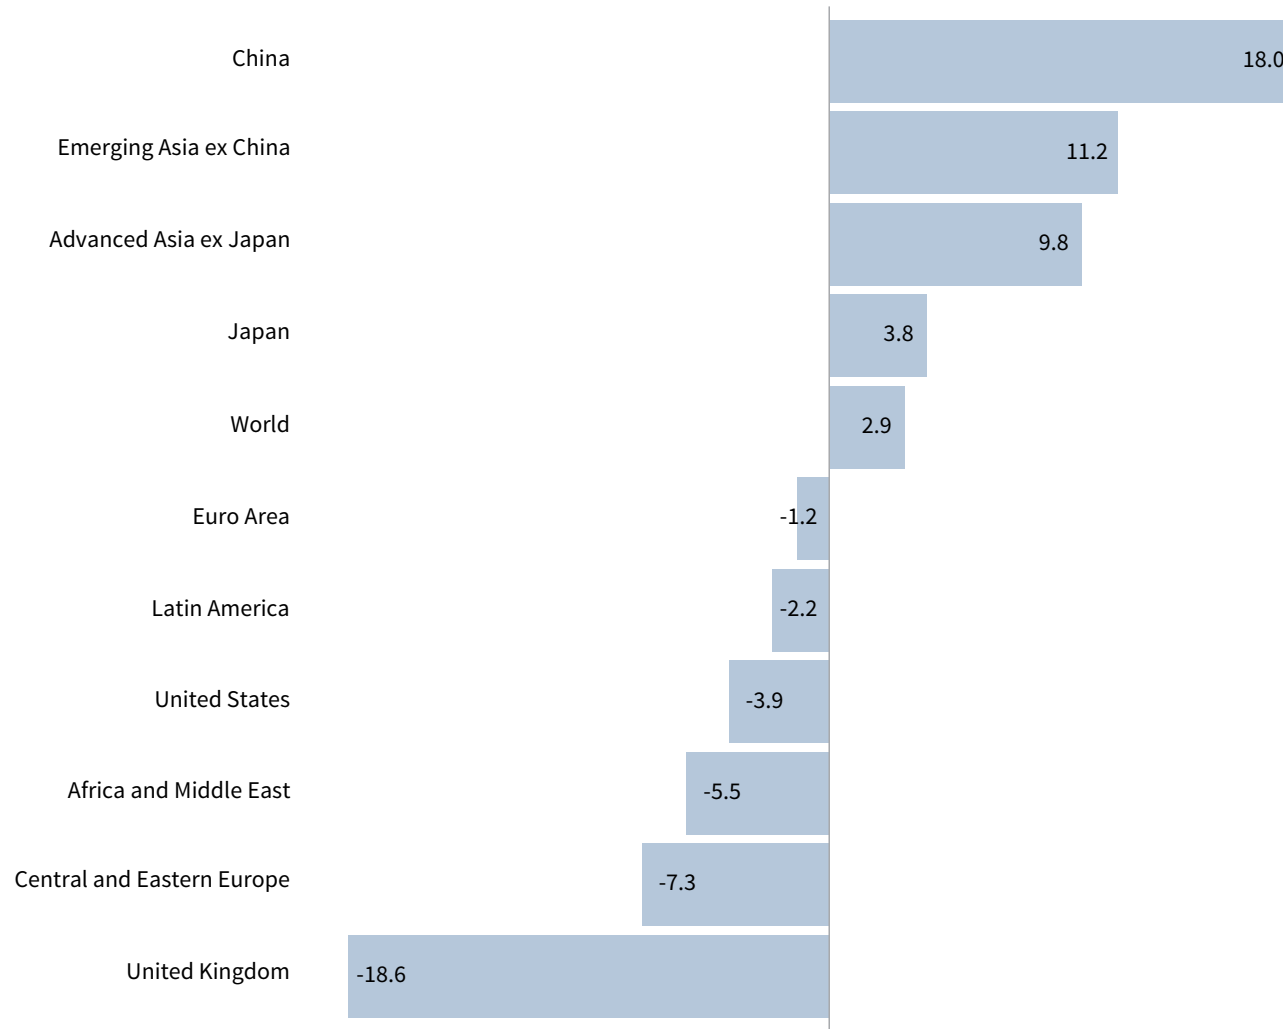

Many monetary and fiscal authorities engaged in unprecedented measures to support economies during the pandemic. Their actions led to a record expansion in money supply. Among the four major developed economies—the euro area, Japan, US, and UK—broad money supply increased \$9.6 trillion to 50.7 trillion from the end of 2019 to present. As a share of the aggregate economy, the money supply increase was equally impressive. This stimulus helped personal income and savings soar. In the US, the savings rate was so high that in six different months during the pandemic the rate was higher than all other available monthly data, which dates to 1959. That build up in wealth, in addition to the pent-up demand from pandemic restrictions, reduced the sensitivity of consumers to prices. This reality, along with reduced demand for services, supported goods inflation.

## The magnitude of the growth in goods demand led to supply chain challenges

### GLOBAL EXPORT GROWTH

As of August 31, 2021 • Percent (%) Change From 2019

Asia is the clear winner from the growth in global goods demand. Relative to prior to the pandemic, China's export volumes have surged 18%. Taiwan (33%), Vietnam (21%), and South Korea (16%) have also experienced considerable increases. The strong rate in growth came as the world wrestled with supply/demand mismatches, virus outbreaks, and more recently, power shortages. These factors resulted in longer-than-expected supply disruptions and exposed the shortcomings of just-in-time manufacturing and global supply networks. While supply bottlenecks have challenged operations, many Asian businesses have been able to pass along higher input prices to less price-sensitive consumers. In fact, in China, the 12% rate of growth in producer prices over the past year very nearly matches the rise in export prices over the same period.

## US order activity suggests demand pressures are still present

**US MANUFACTURERS ORDER ACTIVITY**  
January 2005 – October 2021

New order activity remains elevated relative to history, with 14 of 18 US manufacturing industries reporting growth in new orders in October. These new orders came despite the considerable backlog in existing orders. This congestion is visible at the ports of Los Angeles and Long Beach, where a historically high number of containers ships (~100) have often been anchored at sea waiting to enter and unload raw and intermediate goods for US manufacturers. The difficulty in getting products to market and the surge in demand has caused inventory levels to plummet. While inventory declines are common during recessions, current levels are near the lowest they've been in recent decades. These matters have also been complicated by labor shortages, with manufacturers and nonmanufacturers widely reporting that they are seeking to hire.

## Tight labor markets have pushed up wages

**US WAGE GROWTH BY INCOME QUARTILES**  
January 2000 – September 2021 • Percent (%)

Labor markets have tightened in many countries since last year's downturn. In the US, the employment-to-population ratio of working aged people is just a couple percentage points shy of its peak last cycle. But much more telling is the number of job openings, which relative to the number of unemployed has never been larger. The difficulty in recruiting individuals to work has led to wage gains. To date, these gains have benefited lower-income workers and younger workers disproportionately. Across the Atlantic, the UK is also reporting labor shortages and wage growth gains, with the office of national statistics estimating private sector pay grew between 4.1–5.6%. In the euro area, wage pressures, like core inflation pressures, have so far been less acute.

## Home prices have risen, supported by a confluence of factors

### G4 HOUSE PRICES

December 1980 – June 2021 • 2015 = 100

Several countries are seeing a spike in home prices, which is outpacing the growth in incomes. This is particularly true in the US, where home prices have increased 13.1% over the last year. That rate of growth is the fastest recorded in over four decades, and it is higher than the growth in the UK (8.9%), Japan (7.0%), and the euro area (5.2%). While affordability worsened across each of these countries in the last year, the US's house price-to-income ratio deteriorated the most. These gains are linked in part to unique impacts to supply and demand. On the supply side, pandemic restrictions and scarce raw materials caused new home building to plummet. Also, far fewer existing homes were added to the market, given broad foreclosure protections. On the demand side, many were forced to delay home buying plans, but with higher levels of wealth and access to cheap capital, demand has surged in many areas.

# The pickup in demand and years of under investment led to increases in energy prices

## GLOBAL ENERGY SECTOR DYNAMICS

February 2010 – October 2021 • Percent (%) Change From December 2019 Levels

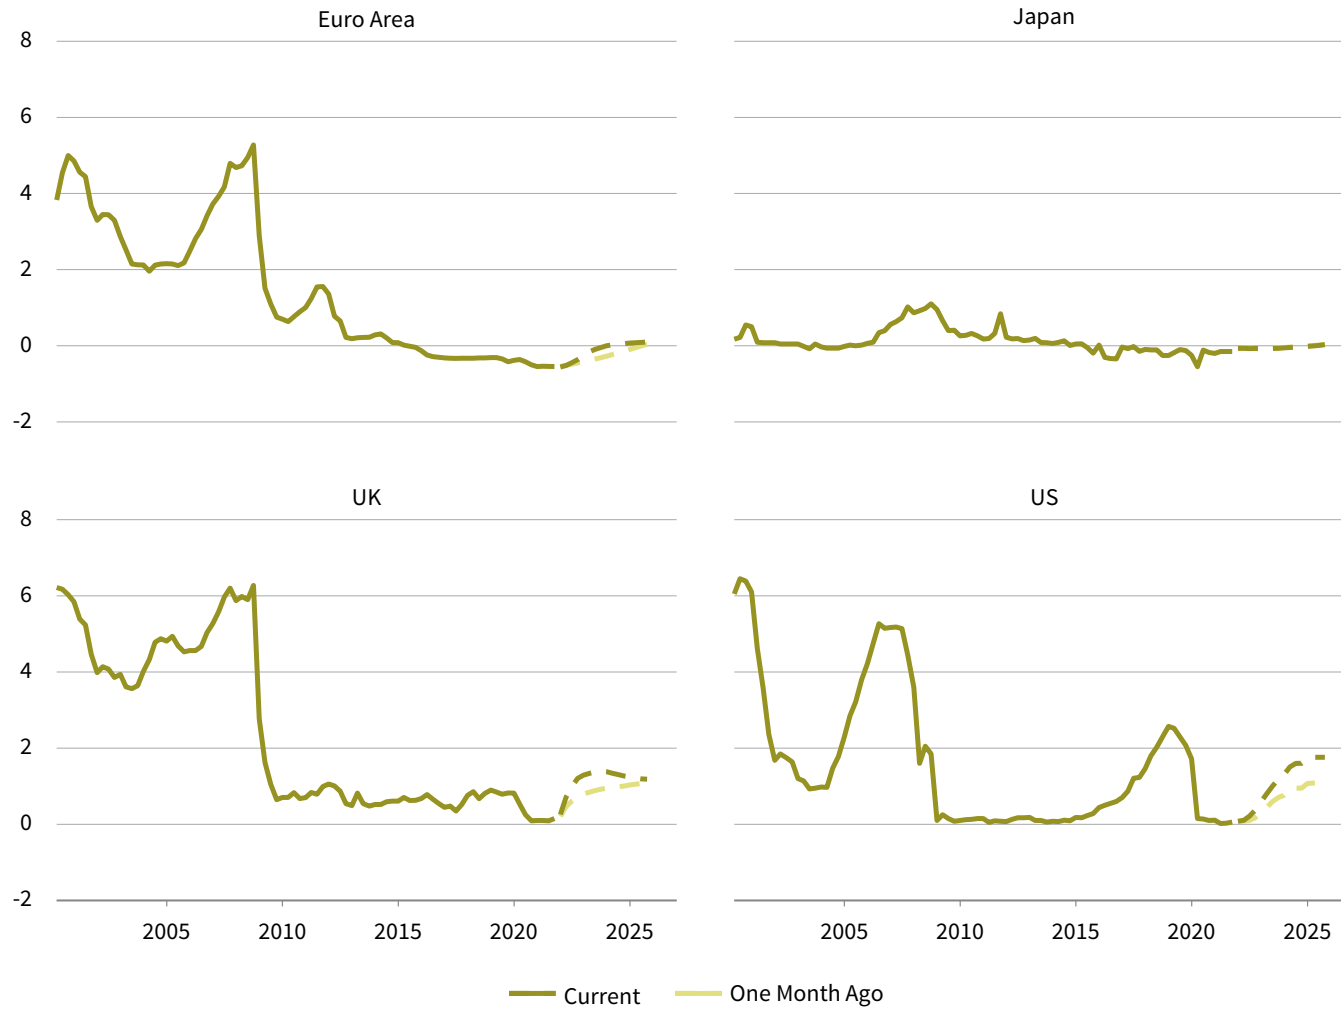

Energy prices have climbed over 60% since the end of 2019, with European natural gas prices up significantly more. Like other areas of the economy, virus outbreaks and pandemic restrictions impacted this sector. More than 1,100 oil & gas rigs went offline in the first eight months of the pandemic, reducing the global count to the lowest level (1,016) since 1975 when data was first tracked. But OPEC and its partner countries are also restricting available crude oil supply. According to the US government, OPEC's unused capacity in 2021 will amount to roughly 7 million barrels per day, almost three times more than its pre-pandemic long-term average. While the cartel has agreed to incrementally deliver more supply to the market, the years of under investment remains a challenge for the industry. Even prior to the pandemic, the industry's investment rate was barely sufficient to keep production stable.

## Inflation pressures have prompted the market to expect rates to rise more quickly

### G4 SHORT-TERM YIELDS

As of November 10, 2021 • Percent (%)

The market's expectation of short-term rates in many major countries are higher now than they were a month ago. This is most evident in the UK and the US. For instance, the futures-implied three-month deposit yield in the UK at the end of 2022 is currently 1.29%, versus 0.80% one month ago or even 0.03% at the beginning of 2021. While the Bank of England's decision to hold rates firm last week did push rate expectations lower in the days that followed, the movement this year has been mostly in one direction. This trend was also visible in US and euro area rates. In the US, market pricing currently suggests that policymakers will probably hike rates for the first time this cycle at the June 2022 meeting, according to CME's Fed watch tool.

## The market expects inflation to moderate next year

### INFLATION-LINKED SWAP RATES

January 01, 2019 – November 09, 2021 • Percent (%)

One way to see the market's embedded expectation of inflation is to compare one year inflation-linked swap rates to a similar one-year swap rate that starts in one year's time, a so-called one-year forward, one-year swap. In the EU, these swap rates diverge considerably (2.8% vs 1.8%), and they indicate that the market expects inflation to be higher this year relative to next year. This moderation in inflation is also expected in the UK and the US, and it is consistent with central bank guidance. Just last week, the Fed repeated its belief that inflation largely reflects "factors that are expected to be transitory." In lockstep, the Bank of England said that global cost pressures will likely "prove transitory, leading to a one-off increase in consumer prices rather than persistently higher inflation rates." Only time will tell if the market and central banks were correct.
