

## Overweight US Small-Cap Equities vs US Equities

Recommended Since April 30, 2022

INVESTMENT THESIS: We expect small-cap equities will outperform their mid- to large-cap counterparts in the United States, given their valuation discount and strong profitability. We like the relative diversifying benefit from their sector exposures. Small-cap equities have historically tended to perform best in the recovery stage of business cycles, and investors could see significant benefit as fundamentals rebound.

KEY SUPPORT #1: US small-cap valuations are steeply discounted relative to US mid- to large-cap equities. The S&P 600® Index trades at a 54% discount to the MSCI US Index's 23.2x normalized price-to-cash earnings multiple, which is in the bottom decile on record based on history back to 2004. Investors have also assigned higher multiples to expected earnings for large-cap stocks relative to small caps. The price-to-forward earnings multiple for the MSCI US Index is 21.9x, 1.31 times higher than that for small-cap stocks. This is 47% higher than the observed median of 0.9 over the past 20 years. However, small-cap valuations have improved more than large caps since the central bank announced plans to begin monetary easing.

## 5-YR EXCESS RETURN S&P 600® VS MSCI USA

- KEY SUPPORT #2: US government initiatives under the Biden administration, such as the Infrastructure Act, the CHIPs Act, and the Inflation Reduction Act, have provided incentives for reshoring of supply chains that would benefit certain sectors overweight in small-cap indexes. Threats of tariffs under the Trump administration could also encourage higher domestic production, potentially boosting small-cap revenues. Although, they may also increase input costs. Moreover, potentially lower corporate taxes and higher deregulation under the new President could provide a tailwind for small-cap equities.
- KEY RISKS: Small-cap companies have lower margins and tend to be more cyclical than larger-cap stocks and thus are more vulnerable to an economic slowdown. Moreover, the recent boom in mega-cap tech stocks saw small caps lag substantially, and a continuation of that rally could further widen the performance gap. The change in the US administration may mean reduced support for the Biden-era government initiatives, negatively impacting growth projections.

Sources: FactSet Research Systems, MSCI Inc., Standard & Poor's, and Thomson Reuters Datastream. MSCI data provided "as is" without any express or implied warranties.

Notes: Excess return data are daily. The cyclically adjusted price-to-cash earnings (CAPCE) ratio is calculated by dividing the inflation-adjusted index price by trailing ten-year average inflation-adjusted cash earnings. Cash earnings are defined as net income from continuing operations plus depreciation and amortization expense. MSCI does not publish cash earnings for banks and insurance companies and therefore excludes these two industry groups from index-level cash earnings. S&P does not calculate a cash earnings metric; cash flow is used as a proxy.
