

Overweight US Small-Cap Equities/Underweight US Equities

Recommended since April 30, 2022

Investment thesis: We expect small-cap equities will outperform their large-cap counterparts in the United States given their historically large valuation discount. Weak earnings growth in recent years had weighed on performance, but small caps have outperformed large-cap peers since second half 2025 as earnings have rebounded. Downside risk exists for small-cap equities should earnings disappoint or interest rates rise. However, as recent performance suggests, there could also be more upside for small cap sectors like industrials if efforts to boost US manufacturing bear fruit.

Key support 1: US small-cap valuations are steeply discounted relative to US mid- to large-cap equities. The S&P 600® Index trades near a 50% discount to the MSCI US Index using normalized price-to-cash earnings multiples. Small caps also trade close to a 20% discount using forward P/E ratios whereas historically they traded at a premium.

Key support 2: Small-cap earnings have been weak in recent years, hurting relative performance, but are rebounding. The S&P 600® Index saw earnings grow 9% in 2025 and forecasted full-year 2026 growth (about 16%) is even higher though trails that for the S&P 500 Index.

Key risks: Small-cap companies have lower margins and higher debt levels than larger-cap stocks, making them more vulnerable to an economic slowdown. Persistent inflationary pressures or geopolitical shocks—such as the current Iran War—could spur inflation and slow Fed easing. Demand for high-quality large-cap stocks could continue to be supported by the strong earnings growth being generated by mega-cap technology stocks.

5-yr excess return S&P 600® vs MSCI US

December 31, 2003 – June 30, 2026 • Rolling 5-yr relative AACR (%)

Relative normalized P/E ratio: S&P 600® vs MSCI US

December 31, 2003 – June 30, 2026

Sources: FactSet Research Systems, MSCI Inc., Standard & Poor's, and Thomson Reuters Datastream. MSCI data provided "as is" without any express or implied warranties.

Notes: Excess return data are daily. The cyclically adjusted price-to-cash earnings (CAPCE) ratio is calculated by dividing the inflation-adjusted index price by trailing ten-year average inflation-adjusted cash earnings. Cash earnings are defined as net income from continuing operations plus depreciation and amortization expense. MSCI does not publish cash earnings for banks and insurance companies and therefore excludes these two industry groups from index-level cash earnings. S&P does not calculate a cash earnings metric; cash flow is used as a proxy.
